Headers!

```
# Header 1

## Header 2

### Header 3

#### Header 4

##### Header 5

###### Header 6
```

Formatting

`**bold**` → **bold**

`_italic_` → *italic*

`**_Bold and italic_**` → ***Bold and italic***

We can also mix the asterisks * and underscores _ like this: `__*works the same*__` → ***works the same***

`==highlighted==` → ==highlighted==

`~~strikethrough~~` → ~~strikethrough~~

---

br

By adding the `<br>` tag to the text adds more space between texts:

Blocks

`> This text is in a blockquote` ↓

> This text is in a blockquote

To include larger chunks of text use three backticks (```) above and underneath the text. ↓

```

This will take all the text and make it a block, and make it easy to copy!

```

↓

```
    This will take all the text and make it a block, and make it easy to copy!
```

Lists

1. Item number 1 [↓]

```
    1. Item number 1
    2. Item number 2
    3. Item number 3
        1. Item A
        2. Item B
            1. Item C
            2. Item D
```

Unordered

We can also create unordered lists using either the + or - sign. Both symbols are interchangeable, so you can use whichever you prefer.

```
    + Item 1
    - Item 2
    + Item 3
        + Item A
        + Item B
        + Item C
```

Tasks

To create a task list, use ☐ Task 1: like this:

```
    - [ ] Task 1
    - [ ] Task 2
    - [x] Task 3
```

Links

Example:

[Google](https://www.google.com)

↓

[Link here](#)

OR

```
https://google.com
```

↓

https://google.com

To jump to a specific header called `## Test`, wright the following: `[Test](#Test)`. The `[Test]` can be anything as long as the `(#Test)` is correct. Just place the `[Test](#Test)` somewhere else in the document to be able to jump to it.

```
## Test
[Test](#Test)
```

↓

Test

[Test](#)

Tables

```
|Title 1|Title 2|Title 3|
|---|---|---|
|Info 1|Info 2|Info 3|
|Data 1|Data 1|Data 1|
```

Code

```
```python
print("Hello World")
```
```

⤓

```
print("Hello World!")
```

> Note that there is no space between the three backticks(```) and the program you want the syntax for.
>
> Like this:
> ```python
> ```

Thanks!

This was the cheat-sheet variant of the guide to faster find what you are looking for. Hope it helps!
